Review: Random Samples

Definition: The random variables X_1, X_2, \dots, X_n are called a **random sample** of size n from the population $f(x)$ if X_1, X_2, \dots, X_n are mutually independent random variables and the marginal pdf or pmf of each X_i is the same function $f(x)$.

Notation: $X_1, X_2, \dots, X_n \sim \text{iid } f$. Joint pdf/pmf:
 $f_{X_1, X_2, \dots, X_n}(x_1, \dots, x_n) = f(x_1, \dots, x_n) := \prod_{i=1}^n f(x_i)$

If f is a member of a parametric family with parameter(s) θ , then we may write $f(x_1, x_2, \dots, x_n \mid \theta) = \prod_{i=1}^n f(x_i \mid \theta)$

Example: $X_1, X_2, \dots, X_n \sim \text{iid } N(\mu, \sigma^2)$ with
 $f(x \mid \mu, \sigma^2) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{1}{2\sigma^2}(x - \mu)^2\right)$

Review: Statistics and Sampling Distributions

Definition: Let X_1, X_2, \dots, X_n be a random sample of size n from a population and let $T(x_1, x_2, \dots, x_n)$ be a function (real-valued or vector-valued) whose domain includes the sample space of (X_1, X_2, \dots, X_n) . The random variable (or vector) $Y = T(X_1, X_2, \dots, X_n)$ is called a **statistic**. The probability distribution of a statistic is called its **sampling distribution**.

Note: A statistic cannot contain a parameter.

Examples:

- (i) sample mean $\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i$,
- (ii) sample variance
$$S^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2 = \frac{1}{n-1} \sum_{i=1}^n X_i^2 - \frac{n}{n-1} \bar{X}^2$$
- (iii) sample standard deviation $S = \sqrt{S^2}$.
- (iv) sample minimum, sample maximum, sample quantiles.

Result (Lemma 5.2.5): Let X_1, X_2, \dots, X_n be a random sample from a population, and let $g(x)$ be a function such that $E(g(X_1))$ and $\text{Var}(g(X_1))$ exist. Then

$$E\left(\sum_{i=1}^n g(X_i)\right) = n E(g(X_1))$$

and

$$\text{Var}\left(\sum_{i=1}^n g(X_i)\right) = n \text{Var}(g(X_1)).$$

Result (Theorem 5.2.6): Let X_1, X_2, \dots, X_n be a random sample from a population with mean μ and variance $\sigma^2 < \infty$. Then

(a) $E(\bar{X}) = \mu$

(b) $\text{Var}(\bar{X}) = \frac{\sigma^2}{n}$; and

(c) $E(S^2) = \sigma^2$.

How to determine the sampling distribution of \bar{X} ?

- (i) **Using transformations.** Let $Y = \sum_{i=1}^n X_i$, so that $\bar{X} = \frac{1}{n} Y$. If $f(x)$ is the pdf of Y , then the pdf of \bar{X} is $f_{\bar{X}}(x) = nf(nx)$.
- (ii) **Using mgf (Theorem 5.2.7).** $M_{\bar{X}}(t) = M_Y\left(\frac{t}{n}\right) = [M_X\left(\frac{t}{n}\right)]^n$ where $M_X(t)$ is the mgf of the underlying population. Then identify the distribution of \bar{X} .

Theorem 5.3.1. Let $X_1, X_2, \dots, X_n \sim \text{iid } N(\mu, \sigma^2)$. Then

- a. \bar{X} and S^2 are independent random variables.
- b. $\bar{X} \sim N(\mu, \sigma^2/n)$.
- c. $(n-1)S^2/\sigma^2 \sim \chi_{n-1}^2$.

Order Statistics

Definition: The order statistics of a random sample X_1, X_2, \dots, X_n are the sample values placed in ascending order. They are denoted by $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ and satisfy $X_{(1)} \leq X_{(2)} \leq \dots \leq X_{(n)}$.

Examples:

- (a) **sample minimum:** $X_{(1)}$ and **sample maximum:** $X_{(n)}$ are called the extreme order statistics.
- (b) **sample range:** $R = X_{(n)} - X_{(1)}$.
- (c) **sample median:** M where

$$M = \begin{cases} X_{((n+1)/2)} & \text{if } n \text{ is odd;} \\ \frac{X_{(n/2)} + X_{(n/2+1)}}{2} & \text{if } n \text{ is even.} \end{cases}$$

Sampling Distributions of Extreme Order Statistics from a Continuous Population

Suppose X_1, X_2, \dots, X_n is a random sample from a population with continuous cdf F and pdf f . Then

1. $\{X_{(n)} \leq x\} = \{\text{all } X_i \leq x\} = \{X_1 \leq x, \dots, X_n \leq x\}$. So

$$\begin{aligned}F_{X_{(n)}}(x) &= P(X_{(n)} \leq x) \\&= P(X_1 \leq x, \dots, X_n \leq x) \\&= P(X_1 \leq x) \dots P(X_n \leq x) \\&= F(x) \dots F(x) = [F(x)]^n\end{aligned}$$

Differentiating, $f_{X_{(n)}}(x) = n f(x) [F(x)]^{n-1}$.

2. $\{X_{(1)} \geq x\} = \{\text{all } X_i \geq x\} = \{X_1 \geq x, \dots, X_n \geq x\}$. Implies $F_{X_{(1)}}(x) = 1 - [1 - F(x)]^n$ & $f_{X_{(1)}}(x) = n f(x) [1 - F(x)]^{n-1}$.

Example: $X_1, X_2, \dots, X_n \sim \text{iid Uniform}(0, \theta)$. Find the pdf and the expected value of $X_{(n)}$.

$$\text{Here } f(x | \theta) = \frac{1}{\theta} I(0 \leq x \leq \theta) \text{ and } F(x | \theta) = \begin{cases} 0, & x < 0 \\ \frac{x}{\theta}, & 0 \leq x \leq \theta \\ 1, & x > \theta \end{cases}$$

so that

$$\begin{aligned} f_{X_{(n)}}(x | \theta) &= n f(x | \theta) [F(x | \theta)]^{n-1} \\ &= n \left(\frac{1}{\theta}\right) \left(\frac{x}{\theta}\right)^{n-1} I(0 \leq x \leq \theta) \\ &= \frac{n x^{n-1}}{\theta^n} I(0 \leq x \leq \theta) \end{aligned}$$

Find expected value $E[X_{(n)}] = E[X_{(n)} | \theta]$ using integration:

$$E[X_{(n)}] = \int_{-\infty}^{\infty} x f_{X_{(n)}}(x | \theta) dx = \frac{n}{\theta^n} \int_0^{\theta} x^n dx = \frac{n}{n+1} \theta$$

Distribution of a general order statistic from a continuous population

Theorem 5.4.4. Let $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ denote the order statistics of a random sample X_1, X_2, \dots, X_n from a continuous population with cdf $F(x)$ and pdf $f(x)$. The pdf of $X_{(j)}$ is

$$f_{X_{(j)}}(x) = \frac{n!}{(j-1)!(n-j)!} f(x) [F(x)]^{j-1} [1-F(x)]^{n-j}.$$

Partial Proof. Call $\{X_i \leq x\}$ a “success,” $\{X_i > x\}$ a “failure.” Define $Z_i = I(X_i \leq x)$ and $Y = \sum_{i=1}^n Z_i$. Note that $Z_i \sim \text{iid Bernoulli}(F(x)) \implies Y \sim \text{Binomial}(n, F(x))$. Note that,

$$F_{X_{(j)}}(x) = P(X_{(j)} \leq x) = P(Y \geq j) = \sum_{k=j}^n \binom{n}{k} [F(x)]^k [1-F(x)]^{n-k}$$

The pdf is obtained using differentiation.

Distribution of a general order statistic from a discrete population

Theorem 5.4.3. Let X_1, X_2, \dots, X_n be a random sample from a discrete distribution with pmf $f(x_i) = p_i$, where $x_1 < x_2 < \dots$ are the possible values of X in ascending order. Let $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ denote the order statistics from the sample. Define

$$P_0 = 0$$

$$P_i = p_1 + p_2 + \dots + p_i \quad \text{for } i \geq 1$$

Then

$$P(X_{(j)} \leq x_i) = \sum_{k=j}^n \binom{n}{k} P_i^k (1 - P_i)^{n-k}$$

$$P(X_{(j)} = x_i) = \sum_{k=j}^n \binom{n}{k} \left[P_i^k (1 - P_i)^{n-k} - P_{i-1}^k (1 - P_{i-1})^{n-k} \right].$$

Proof: cdf is similar to the continuous case. The pmf is obtained from the cdf through

$$P(X_{(j)} = x_i) = P(X_{(j)} \leq x_i) - P(X_{(j)} \leq x_{i-1}).$$

Example: $X_1, X_2, \dots, X_n \sim \text{iid Uniform}(0, 1)$. Find the distribution of the j^{th} order statistic, along with its mean and variance.

Here $f(x) = I(0 < x < 1)$ and $F(x) = x$ for $0 < x < 1$. Therefore

$$\begin{aligned} f_{X_{(j)}}(x) &= \frac{n!}{(j-1)!(n-j)!} f(x) [F(x)]^{j-1} [1 - F(x)]^{n-j} \\ &= \frac{n!}{(j-1)!(n-j)!} x^{j-1} (1-x)^{n-j} I(0 < x < 1) \\ &= \frac{\Gamma(n+1)}{\Gamma(j)\Gamma(n-j+1)} x^{j-1} (1-x)^{n-j} I(0 < x < 1) \end{aligned}$$

This shows that $X_{(j)} \sim \text{Beta}(j, n-j+1)$. From this, we can deduce that

$$E[X_{(j)}] = \frac{j}{n+1}$$

and

$$\text{Var}[X_{(j)}] = \frac{j(n-j+1)}{(n+1)^2(n+2)}.$$

Joint Distribution of Order Statistics

Theorem 5.4.6. Let $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ denote the order statistics of a random sample X_1, X_2, \dots, X_n from a continuous population with cdf $F(x)$ and pdf $f(x)$. The joint pdf of $X_{(i)}$ and $X_{(j)}$, $1 \leq i < j \leq n$, is

$$f_{X_{(i)}, X_{(j)}}(u, v) = c f(u) f(v) [F(u)]^{i-1} [F(v) - F(u)]^{j-1-i} [1 - F(v)]^{n-j}$$

for $-\infty < u < v < \infty$, where $c = \frac{n!}{(i-1)!(j-1-i)!(n-j)!}$.

Joint distribution pdf of all the order statistics from a continuous population:

$$f_{X_{(1)}, \dots, X_{(n)}}(x_1, \dots, x_n) = \begin{cases} n! f(x_1) \dots f(x_n), & -\infty < x_1 < \dots < x_n < \infty \\ 0, & \text{otherwise} \end{cases}$$

Example: Let $X_1, X_2, \dots, X_n \sim \text{iid uniform}(0, a)$,
 $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ denote the order statistics. Find the joint pdf
of the sample range $R = X_{(n)} - X_{(1)}$ and the mid-range
 $V = \frac{X_{(1)} + X_{(n)}}{2}$. Hence find the marginal pdf of R .

First obtain the joint pdf of $X_{(1)}$ and $X_{(n)}$:

$$\begin{aligned} f_{X_{(1)}, X_{(n)}}(x_1, x_n) &= \frac{n(n-1)}{a^2} \left(\frac{x_n}{a} - \frac{x_1}{a} \right)^{n-2} I(0 < x_1 < x_n < a) \\ &= \frac{n(n-1)(x_n - x_1)^{n-2}}{a^n} I(0 < x_1 < x_n < a) \end{aligned}$$

Solve for $X_{(1)}, X_{(n)}$ to obtain $X_{(1)} = V - R/2$ and
 $X_{(n)} = V + R/2$. Jacobian of this transformation is -1.

Support of (R, V) :

$$\begin{aligned}0 < x_1 < x_n < a \\ \implies 0 < v - r/2 < v + r/2 < a \\ \implies 0 < r < a, \quad r/2 < v < a - r/2\end{aligned}$$

The joint pdf of (R, V) is

$$f_{R,V}(r, v) = \frac{n(n-1) r^{n-2}}{a^n}; \quad 0 < r < a, \quad r/2 < v < a - r/2$$

The marginal pdf of R is

$$f_R(r) = \int_{r/2}^{a-r/2} \frac{n(n-1) r^{n-2}}{a^n} dv = \frac{n(n-1) r^{n-2} (a-r)}{a^n}; \quad 0 < r < a$$

It is easy to see that $\frac{R}{a} \sim \text{Beta}(n-1, 2)$ distribution.

HW: find the marginal pdf of V .

Convergence Concepts

What happens to sample statistics, particularly $\bar{X} = \bar{X}_n$, when the sample size $n \rightarrow \infty$?

For a real sequence $(a_n)_{n=1}^{\infty}$ defining convergence is straightforward: $(a_n)_{n=1}^{\infty}$ is said to converge to a point a if $\lim_{n \rightarrow \infty} |a_n - a| = 0$.

How to define convergence of random variables?

- ▶ convergence in probability
- ▶ convergence in almost sure sense
- ▶ convergence in distribution (or law)
- ▶ convergence in mean (or norm) [may be later]

Convergence in Probability (or Weak Convergence)

Definition (5.5.1): A sequence of random variables X_1, X_2, \dots **converges in probability** to a random variable X if, for every $\varepsilon > 0$,

$$\lim_{n \rightarrow \infty} P(|X_n - X| \geq \varepsilon) = 0,$$

or, equivalently,

$$\lim_{n \rightarrow \infty} P(|X_n - X| < \varepsilon) = 1.$$

To indicate this, we write $X_n \xrightarrow{P} X$.

Notes:

1. The random variables X_1, X_2, \dots are NOT assumed to be iid, i.e., we are in a more general setting than what we have discussed so far.
2. We are often interested in the case where the “limiting” random variable X is a constant (degenerate)

Weak Law of Large Numbers (WLLN)

Theorem 5.5.1. Let X_1, X_2, \dots be iid random variables with $E(X_i) = \mu$ and $\text{Var}(X_i) = \sigma^2 < \infty$. Define $\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i$. Then for every $\varepsilon > 0$,

$$\lim_{n \rightarrow \infty} P(|\bar{X}_n - \mu| < \varepsilon) = 1,$$

so that

$$\bar{X}_n \xrightarrow{P} \mu.$$

Proof: Using Chebyshev. For any $\varepsilon > 0$

$$P(|\bar{X}_n - \mu| \geq \varepsilon) \leq \frac{E(\bar{X}_n - \mu)^2}{\varepsilon^2} = \frac{\text{Var}(\bar{X}_n)}{\varepsilon^2} = \frac{\sigma^2}{n\varepsilon^2}.$$

Hence $0 \leq P(|\bar{X}_n - \mu| \geq \varepsilon) \leq \frac{\sigma^2}{n\varepsilon^2} \rightarrow 0$ as $n \rightarrow \infty$.

Remarks:

1. In other words, there is a very high probability that the sample mean can be made as close as we'd like to the population mean by taking n sufficiently large.
2. **Consistency:** when a sample quantity (statistic) converges in probability to a constant (more later).

Example: Suppose we have a sequence X_1, X_2, \dots, X_n are iid random variables with $E(X_i) = \mu$ and $\text{Var}(X_i) = \sigma^2$. Define $S_n^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X}_n)^2$. Can we prove a WLLN for S_n^2 ?

Using Chebyshev

$$P(|S_n^2 - \sigma^2| \geq \varepsilon) \leq \frac{E(S_n^2 - \sigma^2)^2}{\varepsilon^2} = \frac{\text{Var}(S_n^2)}{\varepsilon^2}$$

So a sufficient condition that $S_n^2 \xrightarrow{P} \sigma^2$ is that $\text{Var}(S_n^2) \rightarrow 0$ as $n \rightarrow \infty$.

This sufficient condition holds if $X_1, X_2, \dots, X_n \sim \text{iid } N(\mu, \sigma^2)$.

Then $(n-1)S_n^2/\sigma^2 \sim \chi_{n-1}^2 \implies$

$$\text{Var}\left(\frac{(n-1)S_n^2}{\sigma^2}\right) = \frac{(n-1)^2}{\sigma^4} \text{Var}(S_n^2) = \text{Var}(\chi_{n-1}^2) = 2(n-1)$$

This implies $\text{Var}(S_n^2) = \frac{2\sigma^4}{(n-1)} \rightarrow 0$ as $n \rightarrow \infty$.

Theorem 5.5.4. Suppose that X_1, X_2, \dots converges in probability to a random variable X , and that h is a continuous function. Then $h(X_1), h(X_2), \dots$ converges in probability to $h(X)$.

Proof Homework (see exercise 5.39).

Example (contd.): If $S_n^2 \rightarrow \sigma^2$ then $S_n = \sqrt{S_n^2} \rightarrow \sigma$.

Almost Sure Convergence (or Strong Convergence)

Definition (5.5.6): A sequence of random variables X_1, X_2, \dots **converges almost surely** to a random variable X if, for every $\varepsilon > 0$,

$$P\left(\lim_{n \rightarrow \infty} |X_n - X| < \varepsilon\right) = 1.$$

To indicate this, we write $X_n \xrightarrow{a.s.} X$.

Notes:

- ▶ Contrast this with the definition of convergence in probability.
- ▶ Recall that a random variable is a function from a sample space \mathcal{S} into the real numbers: $X_n : \mathcal{S} \rightarrow \mathbb{R}$. For each $s \in \mathcal{S}$, $X_n(s) = r \in \mathbb{R}$.
- ▶ Definition 5.5.6 states that $X_n \xrightarrow{a.s.} X$ if the functions $X_n(s) \rightarrow X(s)$ for all $s \in \mathcal{S}$, except perhaps for $s \in N$, where $N \subseteq \mathcal{S}$ and $P(N) = 0$ (point-wise convergence on all but a few “null” points).

Homework

- ▶ Order Statistics: Read p. 226 – 232. Exercises 5.22, 5.26.
- ▶ Convergence: Read p. 232 – 236. Exercises 5.32, 5.38, 5.39a.
